

A Note for NetBeans 6.5 Users

The examples in Chapter 41 in the text have been tested using NetBeans 6.0 and 6.0.1. If you use NetBeans 6.5, you need to add binding attributes for visual objects in order to access them from the Java source code.

For example, to make the `CurrentTime` application in §41.2 to work with NetBeans 6.5, you need to add binding attributes for `stCurrentTime` between Step 2 and Step 3 on Page 41-4 and 41-5, as follows:

Step 2.5: Right-click on `stCurrentTime` in the Navigator pane to display a content menu, as shown in the following figure. Choose *Add Binding Attributes*. This step automatically generates code that enables you to access `stCurrentTime` in the Java source code.
